

# Genomics

**The CIS Genomics service enables you to identify your best future herd through a hair or tissue sample of your female animals.**

Genomics helps identify animals with the greatest potential in your herd ensuring you can match your breeding decisions to the goals of the herd.

The results give you the potential to develop traits such as longevity, fertility and disease resistance.

Genomic testing is available for Holsteins, Friesians and Jerseys.

## The CIS Genomic service includes:-

- Genomic production, type and management traits.
- Results for BLAD, Dumps, coat colour, polled and fertility haplotypes.
- Parentage validation, if sire and/or dam are genomic tested.

### Additional options include

- Results for Beta Casein A2, CVM and Brachyspina.
- A full list of other trait tests available on request.

*The Genomic service is also available as a gCOMPLETE service including milk recording, registrations, type classifications and heifer genomic tests.*
